

Benefits of Using RFID for Regulatory Compliance

Because of RFID's success in tracking the physical location and movement of assets and inventory, its value for compliance to a company adds a big number on the plus side of the column.

The Netc Embrace^{RF} Tape Tracking System helps track the entire life cycle of your data tape assets: their deployment, auditing, movement and decommissioning. It monitors the "chain of custody" through the tape library and offsite vaulting process. Essentially, Netc Embrace^{RF} makes it easier for companies to establish an audit trail of ownership rights and physical location. This improves accounting for data tape assets, thereby limiting data loss liability.

The benefits Netc Embrace^{RF} provides for regulatory compliance, alone, will probably not create a case for Return on Investment (ROI). But the compliance piece should not be ignored when added to the many other benefits of robust tape asset tracking solutions:

- Better inventory control
- Improved data tape asset accounting, tracking, control and auditing
- Security of sensitive, high-value, high-vulnerability assets
- Increased security for assets containing customer information

Advantages of Using RFID to Track Tape Assets

In addition to the benefits for regulatory compliance, an RFID solution that automatically tracks, controls and manages tape assets also provides these advantages:

- Faster, more accurate and timely tape library audits
- Faster tape library moves and consolidations
- Comprehensive asset histories and audit trails reduce errors in recording asset movements and statuses
- Reduced asset loss or theft due to management alerts when assets aren't where they should be
- Automated processes that result in significant savings in time and labor costs
- Management dashboards and reports to help monitor key performance indicators and tape location
- Competitive advantage in marketplace

Netc Embrace^{RF} Tape Tracking System is an integrated, single-source, scalable RFID solution that will empower you to achieve your data center tape management, auditing and regulatory compliance goals.
